

Advanced Java

Trainer: Nilesh Ghule

Election Management

Model I architecture

Model-View Arch

appln is divided into two types of components

① Model - Data of the appln

- Java beans as model

- get data from view / send data to views.

+ Java beans also contains Business Logic.

② View - Presentation of data

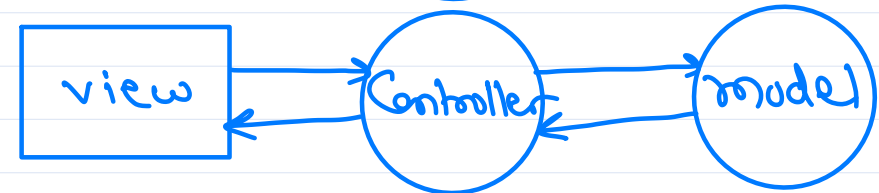

- web pages to display the data

= JSP

Model II architecture

Model-View-Controller Arch

① Controller - Controls data flow and ui flow of the appln.

Controller is typically implemented as a servlet.

Popular MVC frameworks provide built-in Controller. Programmer should implement models, views, and other components accordingly.

Thank you!
